State of Florida
Department of State
Introduction

Students who participate in one or more of Florida's statewide, standardized assessments in grades 3–10 and/or end-of-course (EOC) assessments in Algebra 1, Geometry, Civic, U.S. History, and Biology 1 will receive a detailed score report that is unique to computer-adaptive assessments for each assessment. Each report will contain detailed information about the student’s performance, narratives regarding strengths and weaknesses, and suggestions as to steps parents/guardians can take to help students progress in their learning. The information in each report is intended primarily for students and families and is not intended to replace classroom instruction.

The most detailed narrative is provided at the reporting category level. Reporting categories refer to major groupings of content and skills, such as Reading Informational Text or Reading Prose and Poetry in English Language Arts (ELA); Number Sense and Operations with Whole Numbers or Algebraic Reasoning in Mathematics; Nature of Science in Science; and Roles, Rights, and Responsibilities in Social Studies; among others. For each of the reporting categories, three tiers of text have been created based on state academic standards and informed by the Achievement Level Descriptors (ALDs) that were written by Florida educators. These tiers include Below Expectations, At/Near Expectations or On Grade Level, and Above Expectations. These reports classify student performance into one of the three tiers based on student responses to items that measure the benchmarks associated with that reporting category. Individual benchmark codes can be found in a report beneath the name of the correlated reporting category. Each student’s report is tailored to provide specific information based on which of the three tiers that each reporting category score falls into. This document provides the complete set of narratives so that stakeholders can see expectation progressions within a reporting category and, if appropriate, across grades.

Each description included in these reports and the accompanying next steps were drafted by panels of Florida educators and reviewed by larger Florida educator committees facilitated by EdCount, LLC, and consisting of Florida educators, specialists from the Bureau of Standards and Instructional Support and other Florida Department of Education personnel.

It is important to keep in mind that a student’s overall score provides the most valid and reliable evidence of what the student knows and can do with respect to the state academic standards. Due to the relatively small size of each reporting category, neither individual nor combined reporting category performance should be used to infer overall performance.

For more information on Florida’s statewide, standardized assessments, please see the Statewide Assessments Guide. Please direct questions and comments about these reports to Assessment@fldoe.org.
Additional Resources

The following resources are available to support understanding of the test design for Florida’s statewide, standardized assessments and the skills outlined in the state academic standards.

- B.E.S.T. Standards Achievement Level Descriptions
- Florida’s B.E.S.T. Standards: Mathematics
- FAST Mathematics and B.E.S.T. EOC Test Design Summary
### Grade 3 Mathematics Reporting Category Statements

#### Number Sense and Additive Reasoning

See Benchmarks for Excellent Student Thinking 3.NSO.1.1, 3.NSO.1.2, 3.NSO.1.3, 3.NSO.1.4, 3.NSO.2.1, 3.AR.1.2, 3.AR.3.1, 3.AR.3.3

| **What These Results Mean** | For example, your learner may be able to:  
- Compose and decompose (build and break apart) four-digit numbers using objects or drawings.  
- Plot and compare numbers up to 10,000 using symbols (<, >, =) and a number line with labeled intervals of 10s, 100s, or 1000s.  
- Solve one-step word problems involving addition, subtraction, basic multiplication, and division.  
- Identify a numerical pattern (e.g., *What is the rule for the number pattern: 5, 10, 15, 20, 25, . . . ?*).  
- Determine whether a whole number from 1 to 100 is even or odd.  
- Round whole numbers up to 1,000 to the nearest 10. | For example, your learner may be able to:  
- Read and write numbers up to 10,000 using standard and word form.  
- Compose and decompose (build and break apart) four-digit numbers based on place value.  
- Plot whole numbers up to 10,000 on number lines with different intervals (50s, 100s, 1,000s).  
- Compare numbers up to 10,000 using symbols (<, >, =).  
- Solve one- and two-step problems involving addition and subtraction and one-step problems involving multiplication and division.  
- Determine whether a whole number from 1 to 100 is even or odd.  
- Round whole numbers up to 1,000 to the nearest 10.  
- Identify numerical patterns (e.g., *Bailey collects 6 baseball cards every day. This generates the pattern 6, 12, 18, . . . . What is the rule for this number pattern?*). |
| **Next Steps** | For example, have your learner:  
- Write and read numbers greater than 1,000 when given verbally and in written form.  
- Use manipulatives, such as base-ten blocks, to build number sense to the hundreds and thousands in multiple ways. | For example, have your learner:  
- Read and write numbers in standard form, word form, and expanded notation up to the ten thousands interchangeably. | For example, have your learner:  
- Practice identifying, explaining, and correcting errors in addition and subtraction problems to demonstrate fluency. |

**Disclaimer:** This document is informational and is not for instructional purposes. The knowledge and skills described do not encompass all that a student is expected to learn in this grade.

| **What These Results Mean** | For example, your learner may be able to:  
- Multiply whole numbers by factors of 1, 2, or 5 and related division facts.  
- Multiply one-digit whole numbers by 10.  
- Determine the product of one-digit whole numbers by applying the commutative property (e.g., $4 \times 3 = 3 \times 4$).  
- Determine whether an equation involving multiplication or division with up to three terms is true or false.  
- Determine whether a whole number from 1 to 100 is a multiple of a given one-digit number when given a visual representation.  
- Find the area of a rectangle by counting unit squares that cover the figure. | For example, your learner may be able to:  
- Multiply whole numbers by factors up to and including 10 and related division facts.  
- Multiply one-digit whole numbers by multiples of 10 (up to 90).  
- Determine the product of three or more whole numbers within 12 by applying the commutative and/or associative property [e.g., $2 \times (4 \times 3) = 3 \times (4 \times 2)$].  
- Determine whether an equation involving multiplication and division with up to four terms is true or false.  
- Determine unknown numbers in multiplication and division problems with an unknown number in different positions.  
- Determine whether a whole number in the range of 1 to 100 is a multiple of a given number.  
- Find the area of a rectangle in square units by using a visual model (e.g., using unit squares along the perimeter and relating it to an array model). | For example, your learner may be able to:  
- Multiply whole numbers by factors up to and including 12 and related division facts.  
- Identify and correct errors in equations.  
- Multiply a one-digit number and a two-digit number by applying the distributive property [e.g., $5 \times (20 + 4) = (5 \times 20) + (5 \times 4)$].  
- Determine whether an equation using the four operations is true or false and rewrite false equations as true.  
- Determine whether a whole number from 1 to 144 is a multiple of a given number up to factors of 12.  
- Find the area of a rectangle with whole number side lengths. |

| **Next Steps** | For example, have your learner:  
- Group small objects, such as beans, into equal groups and count them.  
- Practice counting by multiples of any given number up to 12.  
- Practice basic multiplication facts by rolling two dice and multiplying the numbers. | For example, have your learner:  
- Build automaticity with multiplication and division facts up to 12 x 12.  
- Play math games such as *I’m thinking of two numbers whose product is between 15 and 25. What numbers could I be multiplying?* | For example, have your learner:  
- Multiply two whole numbers with products from 0 to 144 and identify their related division facts.  
- Identify and correct errors in incorrect multiplication and division problems.  
- Determine the common multiples when given two numbers between 1 and 12. |

**Disclaimer:** This document is informational and is not for instructional purposes. The knowledge and skills described do not encompass all that a student is expected to learn in this grade.
### Number Sense and Multiplicative Reasoning

### Fractional Reasoning

See Benchmarks for Excellent Student Thinking 3.FR.1.1, 3.FR.1.2, 3.FR.1.3, 3.FR.2.1, 3.FR.2.2

<table>
<thead>
<tr>
<th>Indicator</th>
<th>Below Expectations</th>
<th>At/Near Expectations</th>
<th>Above Expectations</th>
</tr>
</thead>
</table>
| **What These Results Mean** | For example, your learner may be able to:  
- Use a model and fractional notation to represent a fraction. Denominators are limited to 2, 3, 4, 5, and 6.  
- Use a visual model to decompose (break apart) a fraction into unit fractions (e.g., the fraction \( \frac{3}{4} \) is the same as \( \frac{1}{4} + \frac{1}{4} + \frac{1}{4} \)).  
- Read and write fractions less than one in numeral-word form, word form, and standard form. Denominators are limited to 2, 3, and 4 (e.g., the fraction \( \frac{1}{2} \) written in word form is one-half).  
- Plot fractional numbers with the same numerator or denominator on a number line.  
- Identify equivalent fractions that represent one whole (e.g., both \( \frac{2}{2} \) and \( \frac{3}{3} \) equal 1) and one-half (e.g., \( \frac{1}{2} \) and \( \frac{2}{4} \)) using a visual model. | For example, your learner may be able to:  
- Read and write fractions in numeral-word form, word form, and standard form (e.g., the fraction \( \frac{3}{4} \) written in word form is three-fourths and numeral-word form is 3 fourths).  
- Plot and compare fractional numbers with the same numerator or denominator.  
- Identify equivalent fractions (e.g., \( \frac{6}{8} \) and \( \frac{3}{4} \)) using a visual model.  
Denominators are limited to 2, 3, 4, 5, 6, 8, 10, and 12. | For example, your learner may be able to:  
- Represent and interpret fractions including when fractions greater than one are separated into unit parts.  
- Read and write fractions in various forms, including fractions greater than 1 (the fraction \( \frac{3}{2} \) written in word form is three-halves and numeral-word form is 3 halves).  
- Order and compare fractions with the same numerator or denominator.  
- Identify errors in fractional reasoning.  
- Demonstrate and explain why two fractions can be identified as equivalent or non-equivalent. |

| **Next Steps** | For example, have your learner:  
- Identify household items as part of a set or food items sectioned into equal parts as fractions. Identify the fraction that one part represents and add some or all of the equal parts.  
- Explain whether the fraction part gets larger or smaller when the denominator is changed. | For example, have your learner:  
- Use food item sections to represent fractions that have a denominator from 2 to 6 and 8 to 10.  
- Use measuring cups to demonstrate how many \( \frac{1}{3} \) cups are in 1 cup or how many times you refill \( \frac{1}{2} \) cup to make 2 cups.  
- Explain whether a fraction is larger or smaller than another when the | For example, have your learner:  
- Decompose (break apart) a fraction greater than one into two fractions with one being equal to one.  
- Solve real-world problems involving the addition of fractions with the same denominator.  
- Plot, order, and compare fractions with the same numerator or denominator and explain their reasoning. |

**Disclaimer:** This document is informational and is not for instructional purposes. The knowledge and skills described do not encompass all that a student is expected to learn in this grade.
## Fractional Reasoning

</table>
| **What These Results Mean** | For example, your learner may be able to:  
- Select and use appropriate tools to measure length, liquid volume, and temperature to the nearest whole unit.  
- Identify points, lines, line segments, rays, intersecting lines, perpendicular lines, and parallel lines.  
- Identify parallelograms, rhombi, rectangles, squares, and trapezoids as examples of quadrilaterals.  
- Draw a single line of symmetry in a two-dimensional figure.  
- Solve mathematical or real-world problems involving the perimeter or area of rectangles.  
- Solve real-world problems involving addition and subtraction with whole-number lengths, volumes, weights, and temperatures.  
- Use a digital clock to tell and write the time to the nearest minute and designate it as a.m. or p.m.  
- Solve problems involving elapsed time within the same hour.  
- Match a data set to a visual representation (bar graph or pictograph). | For example, your learner may be able to:  
- Select and use appropriate tools to measure length, liquid volume, and temperature to the nearest half or quarter unit.  
- Identify and draw points, lines, line segments, rays, intersecting lines, perpendicular lines, and parallel lines.  
- Identify and draw parallelograms, rhombi, rectangles, squares, and trapezoids as examples of quadrilaterals.  
- Draw two or more lines of symmetry in two-dimensional shapes.  
- Solve mathematical or real-world problems involving the perimeter and area of rectangles, including figures composed of two or more rectangles.  
- Tell and write time to the nearest minute using an analog clock.  
- Solve problems involving elapsed time.  
- Represent and interpret data using tables, pictographs, bar graphs, or line plots. | For example, your learner may be able to:  
- Identify errors in measurement and elapsed time problems.  
- Classify triangles and quadrilaterals (parallelograms, rhombi, rectangles, squares, and trapezoids) according to their attributes (such as parallel or perpendicular lines, right angles, number and lengths of sides).  
- Describe, identify, and draw all lines of symmetry in two-dimensional shapes and explain why some shapes may not have any lines of symmetry.  
- Collect, represent, interpret, and compare data using tables, pictographs, bar graphs, circle graphs, or line plots. |

**Next Steps**  
For example, have your learner:  
- Select the appropriate tool and measure the length (to the nearest half and quarter inch) and liquid volume (to the

| **What These Results Mean** | For example, your learner may be able to:  
- Model a fraction less than one with the denominator 10 as an equivalent fraction with the denominator 100.  
- Represent fractions less than one with denominators of 10 or 100 in decimal notation (e.g., \( \frac{2}{10} = 0.2 \)).  
- Identify equivalent fractions, including fractions greater than one, using models.  
- Plot fractions less than one on a number line.  
- Decompose (break apart) fractions less than one into a sum of two fractions (e.g., \( \frac{2}{3} = \frac{1}{3} + \frac{1}{3} \)).  
- Solve problems involving addition and subtraction of fractions less than one with like denominators with or without using models.  
- Solve problems involving multiplication of a fraction and a whole number with or without using models.  
- Solve one-step problems involving adding and subtracting money with decimal notation. | For example, your learner may be able to:  
- Identify the number that is one-tenth more and one-tenth less than a given number (e.g., one-tenth more than 2.31 is 2.41).  
- Model and write decimal fractions that are equivalent and use that understanding to generate decimals and decimal notation.  
- Identify equivalent fractions including fractions greater than one.  
- Compare fractions, mixed numbers, and fractions greater than one using symbols (<, >, =) and reason about their size.  
- Decompose (break apart) fractions greater than one into a sum of fractions.  
- Solve problems involving addition and subtraction of fractions with like denominators and multiplication of a fraction by a whole number.  
- Add a fraction with a denominator of 10 to a fraction with a denominator of 100.  
- Multiply a fraction by a whole number.  
- Add and subtract money with decimal notation. | For example, your learner may be able to:  
- Identify the number that is one-tenth more, one-tenth less, one-hundredth more, and one-hundredth less than a given number (e.g., one-hundredth less than 5.45 is 5.44).  
- Model and express a fraction, including mixed numbers and fractions greater than one, with the denominator 10 as an equivalent fraction with the denominator of 100.  
- Represent fractions as decimals and decimals as fractions, including fractions greater than one and mixed numbers.  
- Generate equivalent fractions.  
- Plot on a number line, order, and compare fractions with different numerators and denominators.  
- Multiply a fraction by a whole number.  
- Decompose (break apart) mixed numbers into a sum of fractions in multiple ways.  
- Solve one- and two-step addition and subtraction problems involving money. |
| **Next Steps** | For example, have your learner:  
- Generate equivalent fractions using household items as parts of a set, food For example, have your learner:  
- Plot on a number line, order, and compare fractions with different denominators and numerators. | For example, have your learner:  
- Identify and correct errors in equivalent fractions. |

| Next Steps | For example, have your learner:  
- Collect measurements using appropriate tools and convert units from smaller to larger units within a single system of measurement.  
- Identify and use appropriate tools to measure items such as a measuring tape, scale, ruler, measuring spoons, or measuring cup.  
- Identify types of angles found in real-life settings and discuss approximately how many degrees each angle is. For example, the angle formed by a tree and its shadow.  
- Use a protractor to measure angles in whole-number degrees.  
- Calculate the area and perimeter of objects in real-life settings.  
- Read graphs, line plots, and stem-and-leaf plots in the real world. Determine the median, mode, and range of the data set. | For example, have your learner:  
- Convert within a single system of measurement (kilometers, meters, centimeters, millimeters; kilograms, grams; liters, milliliters; and hours, minutes, seconds).  
- Measure objects with precision using a measuring tape, scale, or ruler when appropriate.  
- Identify angles in a real-world or mathematical context as acute, right, obtuse, straight, or reflex and justify the reasoning.  
- Review data presented in print or online and discuss the median, mode, and range of the data and how it contributes to their understanding of the data set.  
- Predict and calculate distance and time measurements. | For example, have your learner:  
- Create real-world problems to convert within a single system of measurement (yards, feet, inches; kilometers, meters, centimeters, millimeters; pounds, ounces; kilograms, grams; gallons, quarts, pints, cups; liters, milliliters; and hours, minutes, seconds).  
- Classify triangles and quadrilaterals into categories according to their defining characteristics, such as number of parallel sides, sides same length, or the presence of a right angle.  
- Identify the error in a real-world problem for area and perimeter and solve (e.g., Stevie has a rectangular garden that is 8 feet long and 15 feet wide. He stated that he needs 120 feet of fencing to put around his garden. Is Stevie correct? Explain).  
- Review data presented in print or online and discuss the median, mode, and range of the data and compare the meaning of each value as it relates to the data set.  
- Create real-world distance and time problems. |

| **What These Results Mean** | For example, your learner may be able to:  
  - Translate written descriptions into linear algebraic expressions.  
  - Represent an inequality on a number line.  
  - Evaluate algebraic expressions using substitution and order of operations using positive integers.  
  - Solve one-step equations using addition or subtraction with a visual model.  
  - Write part-to-part ratios and identify rates for a ratio of quantities using different units. | For example, your learner may be able to:  
  - Translate between written descriptions and linear algebraic expressions.  
  - Translate a real-world description into an inequality and represent the inequality on a number line.  
  - Apply properties of operations to generate equivalent expressions with positive integer coefficients.  
  - Solve one-step equations with positive and negative integers.  
  - Solve math problems involving ratios, rates, and unit rates.  
  - Write and interpret part-to-part and part-to-whole ratios and show the relative size of two quantities in the same units. | For example, your learner may be able to:  
  - Translate between written descriptions and linear algebraic expressions, including error analysis and justification.  
  - Evaluate algebraic expressions using substitution and order of operations.  
  - Explain how properties of operations generate equivalent algebraic expressions.  
  - Write or solve equations in mathematical and real-world contexts using all operations and variables on both sides of the equal sign.  
  - Write, interpret, and calculate ratios and rates given real-world contexts.  
  - Interpret and explain relationships between ratios.  
  - Explain the relationship between the percent, the part, and the whole. |
| **Next Steps** | For example, have your learner:  
  - Use real-world scenarios to write inequality statements.  
  - Practice using order of operations and inverse operations.  
  - Determine whether certain numbers would make situations become true or not. For example, determine how many items can be bought at a store with a certain amount of money.  
  - Use algebra tiles to practice solving one-step equations. | For example, have your learner:  
  - Write expressions and inequalities when given numerical information in real-world contexts (e.g. bank statements).  
  - Practice solving problems involving unit rates by using items found at a store. For example, ask your learner to determine the cost of each apple in a given number of pounds.  
  - Practice part-to-part and part-to-whole ratios by adjusting recipes. For | For example, have your learner:  
  - Translate between written descriptions and linear algebraic expressions.  
  - Evaluate algebraic expressions using substitution and order of operations.  
  - Write or solve equations using all operations and variables given real-world problems.  
  - Calculate and interpret unit rate for a ratio of quantities with different units. |

| **What These Results Mean** | For example, your learner may be able to:  
- Plot ordered pairs on a coordinate plane.  
- Find the surface area of right rectangular prisms and pyramids, given a net.  
- Find the area of quadrilaterals with positive integers.  
- Use a box plot to find the minimum, median, and maximum, and identify the upper and lower quartiles.  
- Describe the spread and distribution of a histogram and line plot. | For example, your learner may be able to:  
- Plot rational number ordered pairs in all four quadrants on a coordinate plane.  
- Find the horizontal or vertical distance between pairs, limited to the same $y$-coordinate or the same $x$-coordinate in any quadrant.  
- Use the formula for the area of a triangle, the volume or surface area of a right rectangular prism, and the area of composite figures to solve problems.  
- Recognize a statistical question.  
- Find the mean, median, mode, and range from a data set.  
- Use box plots and histograms to describe data and determine key features. | For example, your learner may be able to:  
- Plot rational number ordered pairs, find horizontal and vertical distances between pairs in any quadrant, and explain the line of reflection.  
- Solve real-world problems involving the area of quadrilaterals, composite figures, and finding surface area.  
- Formulate and explain statistical questions and interpret mean, median, mode, and range.  
- Create and use a box plot, histogram, or line plot in real-world contexts and describe the distribution and spread of the data.  
- Explain how adding more data to a data set will impact the mean, median, mode, and range. |
| **Next Steps** | For example, have your learner:  
- Practice plotting points and counting spaces to generate fluency with coordinate planes.  
- Cut and measure different sizes of rectangular prisms, such as boxes, to find the surface area and volume of the shape.  
- Track the time engaged in a favorite activity for a week and then find the mean, median, mode, and range of the data.  
- Determine statistical questions from different forms of media. | For example, have your learner:  
- Practice finding the area, surface area, and perimeter of different objects at home, such as quadrilaterals, pyramids, and triangles.  
- Formulate statistical questions and collect data and use the data to produce graphs and charts.  
- Discuss how adding more data to a data set will impact the mean, median, mode, and range.  
- Use different forms of media to read and interpret different graphical data displays. | For example, have your learner:  
- Use graph paper or coordinate grids to plot ordered pairs and find the perimeter and area of the shapes on the grid.  
- Create composite shapes and calculate the area of each shape.  
- Formulate statistical questions to generate a data set and interpret the data. |

| **What These Results Mean**        | For example, your learner may be able to:  
• Identify exponential expressions.  
• Identify equivalent fractions, mixed numbers, and decimals.  
• Use the four basic operations to solve problems that include variables.  
• Solve equations with minimal steps using the order of operations, whole number exponents, and absolute value.  
• Solve one-step inequalities and two-step equations with all positive integers or one rational number. | For example, your learner may be able to:  
• Apply Laws of Exponents to evaluate exponential expressions.  
• Rewrite different forms of rational numbers to solve problems.  
• Use the four basic operations to solve problems involving rational numbers and variables.  
• Use the order of operations with rational numbers in the same form, including negatives, to solve both real-world and mathematical problems.  
• Write and solve one-step inequalities and two-step equations with rational numbers in the same form. | For example, your learner may be able to:  
• Apply Laws of Exponents to generate exponential expressions.  
• Rewrite different forms of rational numbers to solve problems and justify the form chosen.  
• Use the four basic operations to solve problems, including expressions with variables and analyze errors.  
• Solve real-world problems involving operations and interpret the solution in the context of the problem that is presented.  
• Write and solve one-step inequalities and two-step equations and interpret the solution in context of the situation presented. |

| **Next Steps**                     | For example, have your learner:  
• Practice simple operations using exponents, fractions, mixed numbers, and/or decimals (e.g., by calculating prices or adjusting recipes for different serving sizes).  
• Share which operation would be used to arrive at solutions in real-world contexts, such as money exchanges, travel costs, or travel time.  
• Solve problems involving negative numbers using examples such as | For example, have your learner:  
• Practice operations using exponents, fractions, mixed numbers, and decimals by calculating the price of gas or the cost of groceries.  
• Convert between decimals and fractions to describe quantities in real-world contexts such as with money and food portions. | For example, have your learner:  
• Use operations in everyday situations such as income, expenditures, travel, or taxes.  
• Practice real-world application skills by explaining which operations are used to find solutions in various multi-step problems.  
• Practice writing scenarios that represent one-step inequalities, such as how many items can be purchased with a given amount of money. |

| **What These Results Mean** | For example, your learner may be able to:  
- Identify ratios.  
- Solve problems involving a single conversion of units across different measurement systems, given a whole number measurement.  
- Define a proportional relationship.  
- Graph proportional relationships from a table.  | For example, your learner may be able to:  
- Apply ratios to real-world problems.  
- Solve problems involving the conversion of units across different measurement systems (length, area, weight, mass, volume, and money).  
- Determine a proportional relationship by examining a table or graph.  
- Graph a proportional relationship from a table or equation.  
- Find the constant of proportionality from a table or graph.  | For example, your learner may be able to:  
- Solve and interpret multi-step real-world problems involving percents.  
- Solve and interpret problems involving the conversion of units across different measurement systems.  
- Identify and justify proportional relationships by explaining whether the ratio between the two quantities is proportional.  
- Graph a proportional relationship from a table, equation, or written description.  
- Determine and interpret the constant of proportionality from a table, graph, or written description.  |
| **Next Steps** | For example, have your learner:  
- Practice calculating sale prices and discounts.  
- Practice measurement conversion by adjusting recipes or using sales ads.  
- Use proportions to solve real-world problems involving cost, speed, and distance.  | For example, have your learner:  
- Practice multi-step problems by calculating tips and taxes and adding them to the total bill.  
- Use multiple sales ads to explain whether a deal saves money given the information.  
- Set up and solve proportions to practice conversions, such as currency conversions.  | For example, have your learner:  
- Practice calculating percentages in the real-world, such as a sale at a store or a tip for a server.  
- Compare different proportional relationships to determine which is the better value (e.g., price per pound of a 5-pound bag of flour versus price per pound of a 10-pound bag of flour).  
- Explore proportional relationships with models and maps.  |
## Geometric Reasoning

See Benchmarks for Excellent Student Thinking 7.GR.1.1, 7.GR.1.2, 7.GR.1.3, 7.GR.1.4, 7.GR.1.5, 7.GR.2.1, 7.GR.2.2, 7.GR.2.3

| **What These Results Mean** | For example, your learner may be able to:  
- Identify expressions for finding the area of trapezoids, parallelograms, rhombi, and circles.  
- Identify expressions that can be used for the circumference of a circle and area of a given circle.  
- Identify the scale factor in mathematical problems involving dimensions of geometric figures.  
- Determine the expression used for surface area and/or volume. | For example, your learner may be able to:  
- Apply formulas to find the circumference of a circle and the area of parallelograms, rhombi, and circles.  
- Solve mathematical problems involving the area of composite figures composed of triangles or rectangles.  
- Explore the proportional relationship between the circumference and diameter of circles.  
- Find the surface area and volume of a right circular cylinder. | For example, your learner may be able to:  
- Apply formulas to find the circumference of a circle and the area of parallelograms, rhombi, trapezoids, circles, and fractional parts of a circle.  
- Solve real-world problems involving the area of composite figures and multiple polygons.  
- Apply the formula for the circumference of a circle and interpret the solution.  
- Solve and interpret real-world problems involving areas, volumes, and surface areas of right circular cylinders.  
- Solve problems including scale drawings and scale factors. |
| **Next Steps** | For example, have your learner:  
- Find right triangles and rectangles within other shapes to find the area.  
- Calculate the area of objects at home.  
- Explore surface area by using canned food labels and their measurements. | For example, have your learner:  
- Design structures such as a park, an event center, or a driveway with pavers and calculate the total area of objects that would fit within the space.  
- Practice finding scale factor by comparing model cars and a real car or measurements on a map.  
- Measure a cylinder found in your home, calculate the volume and surface area. | For example, have your learner:  
- Explore the relationship between two- and three-dimensional figures.  
- Redesign a room and determine the total allowable measurements of objects that would fit within that space.  
- Identify objects that are cylinders and calculate and compare the volume of each.  
- Create a drawing of rooms in a home or building using a scale factor. |
### Data Analysis and Probability

See Benchmarks for Excellent Student Thinking 7.DP.1.1, 7.DP.1.2, 7.DP.1.3, 7.DP.1.4, 7.DP.1.5, 7.DP.2.1, 7.DP.2.2, 7.DP.2.3, 7.DP.2.4

| **What These Results Mean** | For example, your learner may be able to:  
- Identify outliers in a data set.  
- Calculate mean, median, mode, and range from a data set.  
- Identify an appropriate circle graph for a data set.  
- Identify events that are certain or uncertain to occur.  
- Construct and display data using proportional reasoning.  
- Determine theoretical probabilities. | For example, your learner may be able to:  
- Calculate mean, median, mode, range, measure of center, and measures of variability when given two graphical representations of data.  
- Construct, display, and interpret data in up to four categories in a circle graph.  
- Choose an appropriate graphical representation for a data set.  
- Interpret the likelihood of chance events in the same form.  
- Determine experimental probabilities. | For example, your learner may be able to:  
- Determine the appropriate measure of center or measure of variation to summarize numerical data.  
- Make comparisons, interpret results, draw conclusions, and make predictions regarding two numerical or graphical sets of data.  
- Construct, display, and interpret data in up to six categories in a circle graph.  
- Choose, create, and justify appropriate graphical representations (for example: stem-and-leaf plots and line plots).  
- Compare experimental and theoretical probabilities. |
| **Next Steps** | For example, have your learner:  
- Interpret weather reports using terms such as likely or unlikely for chance of precipitation.  
- Collect data (e.g., family television time or time on devices) and construct representations of the data. | For example, have your learner:  
- Collect data from dice rolls or flipping a coin, determine a sample space, and create a representation of the data set.  
- Use statistics from real-world settings (e.g., money or sports) to interpret what the data mean in terms of events being likely or unlikely to occur. | For example, have your learner:  
- Use statistics from real-world settings (e.g., money or sports) to make predictions.  
- Interpret weather reports to summarize the variation in temperature throughout the day. |

| **What These Results Mean** | For example, your learner may be able to:  
- Identify numbers as rational or irrational.  
- Apply one of the Laws of Exponents to identify equivalent numerical expressions with integer exponents.  
- Determine which number is larger when given two numbers in scientific notation.  
- Solve multi-step mathematical problems with up to three steps involving the order of operations.  
- Solve real-world problems involving probabilities of single experiments. | For example, your learner may be able to:  
- Define irrational numbers and locate approximate values of irrational numbers on a number line.  
- Plot, order, and compare rational and irrational numbers.  
- Evaluate numerical expressions and identify equivalent expressions using the Laws of Exponents with integer exponents.  
- Express numbers in scientific notation and approximate very large quantities.  
- Solve real-world problems involving probabilities of single experiments. | For example, your learner may be able to:  
- Explain why an approximate value of a numerical expression on a number line is reasonable.  
- Generate equivalent numerical expressions when applying the Laws of Exponents.  
- Express and apply operations with numbers in scientific notation and approximate very large and very small quantities.  
- Solve multi-step real-world problems with up to five steps involving the order of operations.  
- Solve real-world problems involving probabilities of single or repeated experiments and make predictions based on theoretical probability. |
| **Next Steps** | For example, have your learner:  
- Practice placing rational numbers on a number line.  
- Use scientific notation to discuss topics, such as the distance from planets and stars, the size of microorganisms, and global populations.  
- Practice determining theoretical probabilities by using different scenarios, such as finding the | For example, have your learner:  
- Convert rational numbers to the same form and order the numbers on a number line.  
- Review correct and incorrect multi-step numerical expressions that are already solved and write out the steps taken to find the solution. | For example, have your learner:  
- Create notecards with numbers in scientific notation, randomly choose two cards, and use all four operations with the chosen numbers.  
- Explore real-world contexts involving radical numbers such as calculating the depreciation of a car’s value.  
- Find probabilities of an event, such as the outcome of a sporting event or a change in weather. Determine whether |

| What These Results Mean | For example, your learner may be able to:  
- Apply the Laws of Exponents when identifying equivalent algebraic expressions using one Law of Exponents.  
- Apply properties of operations to multiply two linear expressions with integer coefficients.  
- Solve multi-step linear equations with variables on one side.  
- Recognize that a solution to a system of equations is an ordered pair.  
- Identify the solution when given a graph of two lines. | For example, your learner may be able to:  
- Apply the Laws of Exponents to identify equivalent algebraic expressions.  
- Apply properties of operations to multiply two linear expressions with rational coefficients.  
- Solve multi-step linear equations in one variable that generate one solution.  
- Determine the ordered pair that satisfies the solution to a system of linear equations.  
- Rewrite an algebraic expression as the product of a monomial and the sum of two algebraic expressions. | For example, your learner may be able to:  
- Provide justification for applying the Laws of Exponents to generate equivalent algebraic expressions.  
- Solve multi-step linear equations that generate one solution, no solution, or infinitely many solutions and interpret the solution in context.  
- Solve two-step linear inequalities and graph solutions of them.  
- Solve a system of equations from a set of possible solutions.  
- Determine from a graph whether there is no solution or infinitely many solutions to a system. |
| Next Steps | For example, have your learner:  
- Graph lines in slope-intercept form \((y = mx + b)\) by charting the constant rate of change over time, such as earnings per hour.  
- Graph inequalities by determining what numbers would make a statement true and placing it on the number line (e.g., \(x > 6. \text{What numbers make this true?}\)). | For example, have your learner:  
- Make flashcards for the exponent rules. Use the flashcards for fluency and solving problems.  
- Solve systems of equations where two lines intersect is a solution, no lines intersect is no solution, and if the lines are the same there are infinite solutions.  
- Practice real-world two-step inequalities, such as determining how many snacks can be bought after purchasing a movie ticket with a limited amount of money to spend. | For example, have your learner:  
- Find graphs with intersecting lines to interpret the meaning of the intersection in context of the graph, such as line graphs that display changes in population demographics, TV viewership, or online platform preferences over time.  
- Explore scenarios when a system of equations would be beneficial, such as determining the best cell phone plan. |

| **What These Results Mean** | For example, your learner may be able to:  
• Determine from a graph whether a relationship is linear.  
• Determine the slope and y-intercept from slope-intercept form.  
• Identify the graph that represents a given linear equation in slope-intercept form.  
• Identify a scatter plot, the type of association, and outliers when given data. | For example, your learner may be able to:  
• Determine whether a function is linear from an equation.  
• Graph linear equations from a table or an equation.  
• Determine the slope from a written description, table, graph, or equation in slope-intercept form.  
• Identify the domain and range of the relation as a list of numbers.  
• Construct a scatter plot or line graph, identify the association, and identify outliers.  
• Identify a line of fit on a scatter plot. | For example, your learner may be able to:  
• Determine whether a relationship is a function from any representation.  
• Determine dependent and independent variables.  
• Determine the slope and write equations in slope-intercept form.  
• Graph linear equations to satisfy a real-world context.  
• Construct a scatter plot or line graph while describing patterns of association and identifying outliers.  
• Justify a line of fit on a scatter plot. |
| **Next Steps** | For example, have your learner:  
• Track data, such as hours per day engaging in a favorite hobby, for one or two weeks, use the data to create a table [Day Number (x) and Amount of Time (y)], graph the results, and determine whether the data represents a linear relationship.  
• Practice using vocabulary terms related to graphing (for example, slope, y-intercept, linear).  
• Find data to create scatter plots. | For example, have your learner:  
• Review scatter plots from online or print sources, determine the association, and identify whether the scatter plot is linear or nonlinear.  
• Generate output tables by practicing basic functions (addition, subtraction, multiplication, and division).  
• Track data, such as hours per day engaging in a favorite hobby, for one or two weeks, use the data to create a table [Day Number (x) and Amount of Time (y)], and develop a scatter plot. | For example, have your learner:  
• Explore the relationship between dependent and independent variables and patterns found in real-world contexts for linear and nonlinear data (e.g., how water affects plant growth or how diet affects weight).  
• Track data for one or two weeks (e.g., hours per day engaging in a favorite hobby), use the data to create a table [Day Number (x) and Amount of Time (y)], graph the results, and write the equation of the line in slope-intercept form. |

| **What These Results Mean** | For example, your learner may be able to:  
- Apply the Pythagorean Theorem to find the hypotenuse of a right triangle resulting in a whole number.  
- Use the Pythagorean Theorem to find the missing side length of a right triangle and distance between two points on a coordinate plane.  
- Define angle relationships.  
- Generate or identify a translation. | For example, your learner may be able to:  
- Apply the Pythagorean Theorem to solve problems involving unknown side lengths in right triangles.  
- Apply the Pythagorean Theorem to find unknown side lengths and distance between two points on a coordinate plane.  
- Solve problems involving angle relationships and their numerical angle measures.  
- Develop formulas for the interior angles of regular polygons.  
- Identify transformations. | For example, your learner may be able to:  
- Apply the Pythagorean Theorem to mathematical and real-world problems.  
- Solve problems involving multiple relationships between angles.  
- Develop and use formulas for the sum of interior angles of regular polygons.  
- Identify, analyze, and describe a transformation that represents a relationship. |
| **Next Steps** | For example, have your learner:  
- Practice real-world problems involving the Pythagorean theorem (e.g., television measurements, computer screens, or cell phones).  
- Create flashcards to practice angle terminology and explore angle measurements in real-life settings.  
- Explore items that can reflect an image (e.g., looking in a mirror or a camera on a phone). | For example, have your learner:  
- Use a random number generator to choose three numbers and determine whether the three numbers can form a triangle.  
- Practice real-world problems involving the Pythagorean Theorem (e.g., television measurements, computer screens, or cell phones).  
- Explore rotation by determining how many degrees an item rotates. | For example, have your learner:  
- Explore relationships between angles in the real-world (e.g., in sports, clothing design, or construction).  
- Explore transformations of objects (e.g., in art, landscaping, or interior design). |

| **What These Results Mean** | For example, your learner may be able to:  
- Solve one-variable multistep linear equations represented in a real-world context and one-variable multi-step linear inequalities represented in a mathematical context.  
- Identify the solutions and graphs of mathematical problems that are modeled with linear functions.  
- Identify from a graph or a set of equations when two lines are parallel or perpendicular.  
- Compare key features between two graphed linear functions.  
- Identify the graph that represents the solution set of a two-variable inequality or a system of two-variable inequalities.  
- Solve systems of two-variable equations when given in a mathematical context. | For example, your learner may be able to:  
- Identify and solve one variable, multi-step linear equations in a real-world context.  
- Write and solve one variable, multistep linear inequalities and represent their solutions on a number line.  
- Write a linear, two-variable equation in a mathematical context when given a graph, a written description, or a table of values.  
- Identify the graph of a linear function and key features such as domain and range when given an equation in slope-intercept or point-slope form.  
- Write equations of lines parallel and perpendicular to a given line through a given point when represented on a graph.  
- Compare key features of linear functions when represented graphically or algebraically.  
- Write, graph, and identify the solution set to a two-variable linear inequality.  
- Identify and solve systems of two-variable equations and inequalities when given in a mathematical or real-world context. | For example, your learner may be able to:  
- Write, solve, and interpret solutions of linear equations, linear inequalities, systems of linear equations, and systems of linear inequalities.  
- Analyze and correct errors in linear equations and inequalities.  
- Analyze solutions as viable or not viable in systems of equations and inequalities.  
- Fit a linear function to data and use it to solve real-world problems and make predictions in terms of the context of the data. |

| Next Steps | For example, have your learner:  
- Write and solve one-variable multi-step linear equations and inequalities from real-world contexts. | For example, have your learner:  
- Extend knowledge of linear relationships to problems represented in real-world contexts. | For example, have your learner:  
- Analyze errors in worked examples and make appropriate corrections. |

<td>• Solve problems involving triangles and quadrilaterals in a real-world context.</td>
</tr>
<tr>
<td></td>
<td>• Solve mathematical problems involving lines, triangles, and midpoints of segments and slope.</td>
<td>• Calculate the area or perimeter of polygons in both mathematical and real-world contexts.</td>
<td>• Calculate the area of composite polygons in both mathematical and real-world contexts.</td>
</tr>
<tr>
<td></td>
<td>• Identify two-dimensional cross sections of right cylinders and right rectangular prisms.</td>
<td>• Identify two-dimensional cross sections of right cylinders and right prisms.</td>
<td>• Identify cross sections of three-dimensional figures, including when the cross section is not parallel or perpendicular to the base of the figure.</td>
</tr>
<tr>
<td></td>
<td>• Identify the equation of a circle given the center and radius.</td>
<td>• Solve mathematical and real-world problems involving the area of quadrilaterals or triangles, including population density.</td>
<td>• Solve mathematical and real-world problems involving the area of two-dimensional figures including population density.</td>
</tr>
<tr>
<td></td>
<td>• Solve mathematical problems involving the volume of right cylinders, right pyramids, and right prisms and the surface area of right pyramids and right prisms.</td>
<td>• Solve mathematical and real-world problems about the volume and surface area of right cylinders, right pyramids, and right cones.</td>
<td>• Solve mathematical and real-world problems about the volume and surface area of three-dimensional figures, including composite figures.</td>
</tr>
<tr>
<td></td>
<td>• Use trigonometric ratios and the Pythagorean Theorem to determine the missing side of a right triangle.</td>
<td>• Create an equation and graph a circle when completing the square is not required.</td>
<td>• Graph and solve real-world problems using equations of circles.</td>
</tr>
<tr>
<td></td>
<td>• Use trigonometric ratios to solve for missing angles and/or sides of a right triangle.</td>
<td>• Use trigonometric ratios to solve for missing angles and/or sides of a right triangle.</td>
<td>• Use trigonometric ratios and the Pythagorean Theorem to solve for missing angles and/or sides of non-right triangles.</td>
